

We set certain tasks that require to finish in each of the sprint so far. In the case of when we couldn't finish some of the sub tasks, we move it to the next sprint. The reason we couldn't finish some of the tasks was due to dependencies. In the network diagram, we would need the back end to get the front end login and sign up, which connects to DEV-006 and DEV-014. For DEV-003, we would first need the completion of DEV-010 that connects to DEV-006. We learn that we need to do the most important tasks first, so others can move forward smoothly. For the other new tasks we created for the sprint, it has the same problem as before but this time we completed the back end, so the rest are going smoothly. We still couldn't finish some of them due to completion of backend being late.
