

We set certain tasks that require us to finish in each of the sprint so far. The reason we couldn't finish some of the tasks was due to dependencies. We learned that we need to do the most important tasks first, so others can move forward smoothly. For the other new tasks we created for the sprint, we have been able to progress more since the backend is finishing up. We still couldn't finish some of them due to the backend being delayed until this sprint. In the case we finish the backlog ahead of schedule, we have included 3 spikes that would enhance the product, but if we do not have time for them it is ok, which is why they have their own path on the diagram.
